

# Package: rlibkriging (via r-universe)

August 24, 2024

**Type** Package

**Title** Kriging Models using the 'libKriging' Library

**Version** 0.9-0

**Date** 2024-08-23

**Maintainer** Yann Richet <yann.richet@irsn.fr>

**Description** Interface to 'libKriging' 'C++' library  
<<https://github.com/libKriging>> that should provide most standard Kriging / Gaussian process regression features (like in 'DiceKriging', 'kergp' or 'RobustGaSP' packages).  
'libKriging' relies on Armadillo linear algebra library (Apache 2 license) by Conrad Sanderson, 'lbfgsb\_cpp' is a 'C++' port around 'lbfgsb' library (BSD-3 license) by Ciyou Zhu, Richard Byrd, Jorge Nocedal and Jose Luis Morales used for hyperparameters optimization.

**License** Apache License (>= 2)

**Encoding** UTF-8

**LinkingTo** Rcpp, RcppArmadillo

**Depends** R (>= 4.2)

**Imports** Rcpp (>= 0.12.11), methods, DiceKriging

**Suggests** testthat, RobustGaSP, utils, DiceDesign, foreach

**SystemRequirements** GNU make, cmake (>= 3.2.0), gcc, gfortran

**URL** <https://github.com/libKriging>

**RoxygenNote** 7.3.1

**NeedsCompilation** yes

**Author** Yann Richet [aut, cre]  
(<<https://orcid.org/0000-0002-5677-8458>>), Pascal Havé [aut],  
Yves Deville [aut], Conrad Sanderson [ctb], Ciyou Zhu [ctb],  
Richard Byrd [ctb], Jorge Nocedal [ctb], Jose Luis Morales  
[ctb], Mike Smith [ctb]

**Date/Publication** 2024-08-23 16:00:02 UTC

**Repository** <https://yannrichet-irsn.r-universe.dev>

**RemoteUrl** <https://github.com/cran/rlibkriging>

**RemoteRef** HEAD

**RemoteSha** 6f73650540cc637d4c7285ca4041714fd29e9cf6

---

as.km	<i>Coerce an Object into a km Object</i>
-------	--

---

**Description**

Coerce an object into an object with S4 class "km" from the **DiceKriging** package.

**Usage**

```
as.km(x, ...)
```

**Arguments**

x	Object to be coerced.
...	Further arguments for methods.

**Details**

Such a coercion is typically used to compare the performance of the methods implemented in the current **rlikkriging** package to those which are available in the **DiceKriging** package.

**Value**

An object with S4 class "km".

---

as.km.Kriging	<i>Coerce a Kriging object into the "km" class of the <b>DiceKriging</b> package.</i>
---------------	---

---

**Description**

Coerce a Kriging object into the "km" class of the **DiceKriging** package.

**Usage**

```
## S3 method for class 'Kriging'
as.km(x, .call = NULL, ...)
```

**Arguments**

x	An object with S3 class "Kriging".
.call	Force the call slot to be filled in the returned km object.
...	Not used.

**Value**

An object of having the S4 class "KM" which extends the "km" class of the **DiceKriging** package and contains an extra Kriging slot.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, "matern3_2")
print(k)

k_km <- as.km(k)
print(k_km)
```

---

as.km.NoiseKriging      *Coerce a NoiseKriging object into the "km" class of the **DiceKriging** package.*

---

**Description**

Coerce a NoiseKriging object into the "km" class of the **DiceKriging** package.

**Usage**

```
## S3 method for class 'NoiseKriging'
as.km(x, .call = NULL, ...)
```

**Arguments**

x	An object with S3 class "NoiseKriging".
.call	Force the call slot to be filled in the returned km object.
...	Not used.

**Value**

An object of having the S4 class "KM" which extends the "km" class of the **DiceKriging** package and contains an extra NoiseKriging slot.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + X/10 * rnorm(nrow(X)) # add noise dep. on X
## fit and print
k <- NoiseKriging(y, noise=(X/10)^2, X, kernel = "matern3_2")
print(k)

k_km <- as.km(k)
print(k_km)
```

---

as.km.NuggetKriging	<i>Coerce a NuggetKriging object into the "km" class of the <b>DiceKriging</b> package.</i>
---------------------	---

---

**Description**

Coerce a NuggetKriging object into the "km" class of the **DiceKriging** package.

**Usage**

```
## S3 method for class 'NuggetKriging'
as.km(x, .call = NULL, ...)
```

**Arguments**

x	An object with S3 class "NuggetKriging".
.call	Force the call slot to be filled in the returned km object.
...	Not used.

**Value**

An object of having the S4 class "KM" which extends the "km" class of the **DiceKriging** package and contains an extra NuggetKriging slot.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))

k <- NuggetKriging(y, X, "matern3_2")
```

```
print(k)

k_km <- as.km(k)
print(k_km)
```

---

as.list.Kriging	<i>Coerce a Kriging Object into a List</i>
-----------------	--

---

## Description

Coerce a Kriging Object into a List

## Usage

```
## S3 method for class 'Kriging'
as.list(x, ...)
```

## Arguments

x	An object with class "Kriging".
...	Ignored

## Value

A list with its elements copying the content of the Kriging object fields: kernel, optim, objective, theta (vector of ranges), sigma2 (variance), X, centerX, scaleX, y, centerY, scaleY, regmodel, F, T, M, z, beta.

## Author(s)

Yann Richet <yann.richet@irsn.fr>

## Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2")

l <- as.list(k)
cat(paste0(names(l), " = " , l, collapse = "\n"))
```

---

as.list.NoiseKriging *Coerce a NoiseKriging Object into a List*

---

## Description

Coerce a NoiseKriging Object into a List

## Usage

```
## S3 method for class 'NoiseKriging'  
as.list(x, ...)
```

## Arguments

x	An object with class "NoiseKriging".
...	Ignored

## Value

A list with its elements copying the content of the NoiseKriging object fields: kernel, optim, objective, theta (vector of ranges), sigma2 (variance), X, centerX, scaleX, y, centerY, scaleY, regmodel, F, T, M, z, beta.

## Author(s)

Yann Richet <yann.richet@irsn.fr>

## Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X) + X/10 * rnorm(nrow(X)) # add noise dep. on X  
  
k <- NoiseKriging(y, noise=(X/10)^2, X, kernel = "matern3_2")  
  
l <- as.list(k)  
cat(paste0(names(l), " = " , l, collapse = "\n"))
```

---

as.list.NuggetKriging *Coerce a NuggetKriging Object into a List*

---

## Description

Coerce a NuggetKriging Object into a List

## Usage

```
## S3 method for class 'NuggetKriging'  
as.list(x, ...)
```

## Arguments

x	An object with class "NuggetKriging".
...	Ignored

## Value

A list with its elements copying the content of the NuggetKriging object fields: kernel, optim, objective, theta (vector of ranges), sigma2 (variance), X, centerX, scaleX, y, centerY, scaleY, regmodel, F, T, M, z, beta.

## Author(s)

Yann Richet <yann.richet@irsn.fr>

## Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X) + 0.1 * rnorm(nrow(X))  
  
k <- NuggetKriging(y, X, kernel = "matern3_2")  
  
l <- as.list(k)  
cat(paste0(names(l), " = " , l, collapse = "\n"))
```

---

classKriging	<i>Shortcut to provide functions to the S3 class "Kriging"</i>
--------------	--

---

**Description**

Shortcut to provide functions to the S3 class "Kriging"

**Usage**

```
classKriging(nk)
```

**Arguments**

nk                    A pointer to a C++ object of class "Kriging"

**Value**

An object of class "Kriging" with methods to access and manipulate the data

---

classNoiseKriging	<i>Shortcut to provide functions to the S3 class "NoiseKriging"</i>
-------------------	---

---

**Description**

Shortcut to provide functions to the S3 class "NoiseKriging"

**Usage**

```
classNoiseKriging(nk)
```

**Arguments**

nk                    A pointer to a C++ object of class "NoiseKriging"

**Value**

An object of class "NoiseKriging" with methods to access and manipulate the data

---

`classNuggetKriging`      *Shortcut to provide functions to the S3 class "NuggetKriging"*

---

**Description**

Shortcut to provide functions to the S3 class "NuggetKriging"

**Usage**

```
classNuggetKriging(nk)
```

**Arguments**

`nk`                      A pointer to a C++ object of class "NuggetKriging"

**Value**

An object of class "NuggetKriging" with methods to access and manipulate the data

---

`copy`                      *Duplicate object.*

---

**Description**

Duplicate a model given in object.

**Usage**

```
copy(object, ...)
```

**Arguments**

`object`                  An object representing a fitted model.  
`...`                      Ignored.

**Value**

The copied object.

---

`copy.Kriging`*Duplicate a Kriging Model*

---

**Description**

Duplicate a Kriging Model

**Usage**

```
## S3 method for class 'Kriging'  
copy(object, ...)
```

**Arguments**

<code>object</code>	An S3 Kriging object.
<code>...</code>	Not used.

**Value**

The copy of object.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X)  
  
k <- Kriging(y, X, kernel = "matern3_2", objective="LMP")  
print(k)  
  
print(copy(k))
```

---

`copy.NoiseKriging`*Duplicate a NoiseKriging Model*

---

**Description**

Duplicate a NoiseKriging Model

**Usage**

```
## S3 method for class 'NoiseKriging'  
copy(object, ...)
```

**Arguments**

object	An S3 NoiseKriging object.
...	Not used.

**Value**

The copy of object.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X) + X/10 * rnorm(nrow(X))  
  
k <- NoiseKriging(y, (X/10)^2, X, kernel = "matern3_2", objective="LL")  
print(k)  
  
print(copy(k))
```

---

copy.NuggetKriging      *Duplicate a NuggetKriging Model*

---

**Description**

Duplicate a NuggetKriging Model

**Usage**

```
## S3 method for class 'NuggetKriging'  
copy(object, ...)
```

**Arguments**

object	An S3 NuggetKriging object.
...	Not used.

**Value**

The copy of object.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))

k <- NuggetKriging(y, X, kernel = "matern3_2", objective="LMP")
print(k)

print(copy(k))
```

---

covMat

*covariance function*

---

**Description**

Compute the covariance matrix of a model given in object, between given set of points.

**Usage**

```
covMat(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Further arguments of function (eg. points, range).

**Value**

The covariance matrix.

---

covMat.Kriging	<i>Compute Covariance Matrix of Kriging Model</i>
----------------	---

---

**Description**

Compute Covariance Matrix of Kriging Model

**Usage**

```
## S3 method for class 'Kriging'  
covMat(object, x1, x2, ...)
```

**Arguments**

object	An S3 Kriging object.
x1	Numeric matrix of input points.
x2	Numeric matrix of input points.
...	Not used.

**Value**

A matrix of the covariance matrix of the Kriging model.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X)  
  
k <- Kriging(y, X, kernel = "gauss")  
  
x1 = runif(10)  
x2 = runif(10)  
  
covMat(k, x1, x2)
```

---

covMat.NoiseKriging    *Compute Covariance Matrix of NoiseKriging Model*

---

### Description

Compute Covariance Matrix of NoiseKriging Model

### Usage

```
## S3 method for class 'NoiseKriging'  
covMat(object, x1, x2, ...)
```

### Arguments

object	An S3 NoiseKriging object.
x1	Numeric matrix of input points.
x2	Numeric matrix of input points.
...	Not used.

### Value

A matrix of the covariance matrix of the NoiseKriging model.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X) + X/10 * rnorm(nrow(X))  
  
k <- NoiseKriging(y, (X/10)^2, X, "matern3_2")  
  
x1 = runif(10)  
x2 = runif(10)  
  
covMat(k, x1, x2)
```

---

covMat.NuggetKriging *Compute Covariance Matrix of NuggetKriging Model*

---

### Description

Compute Covariance Matrix of NuggetKriging Model

### Usage

```
## S3 method for class 'NuggetKriging'  
covMat(object, x1, x2, ...)
```

### Arguments

object	An S3 NuggetKriging object.
x1	Numeric matrix of input points.
x2	Numeric matrix of input points.
...	Not used.

### Value

A matrix of the covariance matrix of the NuggetKriging model.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X)  
  
k <- NuggetKriging(y, X, kernel = "gauss")  
  
x1 = runif(10)  
x2 = runif(10)  
  
covMat(k, x1, x2)
```

---

fit	<i>Fit model on data.</i>
-----	---------------------------

---

**Description**

Fit a model given in object.

**Usage**

```
fit(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Further arguments of function

**Value**

No return value. Kriging object argument is modified.

---

fit.Kriging	<i>Fit Kriging object on given data.</i>
-------------	--

---

**Description**

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by objective, using the method given in optim.

**Usage**

```
## S3 method for class 'Kriging'
fit(
  object,
  y,
  X,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "Newton", "none"),
  objective = c("LL", "LOO", "LMP"),
  parameters = NULL,
  ...
)
```

**Arguments**

object	S3 Kriging object.
y	Numeric vector of response values.
X	Numeric matrix of input design.
regmodel	Universal Kriging linear trend: "constant", "linear", "interactive", "quadratic".
normalize	Logical. If TRUE both the input matrix X and the response y in normalized to take values in the interval [0, 1].
optim	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS", "Newton" and "none", the later simply keeping the values given in parameters. The method "BFGS" uses the gradient of the objective (note that "BGFS10" means 10 multi-start of BFGS). The method "Newton" uses both the gradient and the Hessian of the objective.
objective	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood, "LOO" for the Leave-One-Out sum of squares and "LMP" for the Log-Marginal Posterior.
parameters	Initial values for the hyper-parameters. When provided this must be named list with elements "sigma2" and "theta" containing the initial value(s) for the variance and for the range parameters. If theta is a matrix with more than one row, each row is used as a starting point for optimization.
...	Ignored.

**Value**

No return value. Kriging object argument is modified.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)
points(X, y, col = "blue", pch = 16)

k <- Kriging("matern3_2")
print(k)

fit(k,y,X)
print(k)
```

---

fit.NoiseKriging      *Fit NoiseKriging object on given data.*

---

### Description

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by `objective`, using the method given in `optim`.

### Usage

```
## S3 method for class 'NoiseKriging'
fit(
  object,
  y,
  noise,
  X,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "none"),
  objective = c("LL"),
  parameters = NULL,
  ...
)
```

### Arguments

<code>object</code>	S3 NoiseKriging object.
<code>y</code>	Numeric vector of response values.
<code>noise</code>	Numeric vector of response variances.
<code>X</code>	Numeric matrix of input design.
<code>regmodel</code>	Universal NoiseKriging "linear", "interactive", "quadratic".
<code>normalize</code>	Logical. If TRUE both the input matrix <code>X</code> and the response <code>y</code> in normalized to take values in the interval $[0, 1]$ .
<code>optim</code>	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS" and "none", the later simply keeping the values given in <code>parameters</code> . The method "BFGS" uses the gradient of the objective (note that "BGFS10" means 10 multi-start of BFGS).
<code>objective</code>	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood.
<code>parameters</code>	Initial values for the hyper-parameters. When provided this must be named list with elements "sigma2" and "theta" containing the initial value(s) for the variance and for the range parameters. If <code>theta</code> is a matrix with more than one row, each row is used as a starting point for optimization.
<code>...</code>	Ignored.

**Value**

No return value. NoiseKriging object argument is modified.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + X/10 * rnorm(nrow(X)) # add noise dep. on X
points(X, y, col = "blue", pch = 16)

k <- NoiseKriging("matern3_2")
print(k)

fit(k,y,noise=(X/10)^2,X)
print(k)
```

---

fit.NuggetKriging      *Fit NuggetKriging object on given data.*

---

**Description**

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by objective, using the method given in optim.

**Usage**

```
## S3 method for class 'NuggetKriging'
fit(
  object,
  y,
  X,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "none"),
  objective = c("LL", "LMP"),
  parameters = NULL,
  ...
)
```

**Arguments**

object	S3 NuggetKriging object.
y	Numeric vector of response values.
X	Numeric matrix of input design.
regmodel	Universal NuggetKriging "linear", "interactive", "quadratic".
normalize	Logical. If TRUE both the input matrix X and the response y in normalized to take values in the interval [0, 1].
optim	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS" and "none", the later simply keeping the values given in parameters. The method "BFGS" uses the gradient of the objective (note that "BFGS10" means 10 multi-start of BFGS).
objective	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood and "LMP" for the Log-Marginal Posterior.
parameters	Initial values for the hyper-parameters. When provided this must be named list with some elements "sigma2", "theta", "nugget" containing the initial value(s) for the variance, range and nugget parameters. If theta is a matrix with more than one row, each row is used as a starting point for optimization.
...	Ignored.

**Value**

No return value. NuggetKriging object argument is modified.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))
points(X, y, col = "blue", pch = 16)

k <- NuggetKriging("matern3_2")
print(k)

fit(k,y,X)
print(k)
```

**Description**

Create an object of S4 class "KM" similar to a km object in the **DiceKriging** package.

**Usage**

```

KM(
  formula = ~1,
  design,
  response,
  covtype = c("matern5_2", "gauss", "matern3_2", "exp"),
  coef.trend = NULL,
  coef.cov = NULL,
  coef.var = NULL,
  nugget = NULL,
  nugget.estim = FALSE,
  noise.var = NULL,
  estim.method = c("MLE", "LOO"),
  penalty = NULL,
  optim.method = "BFGS",
  lower = NULL,
  upper = NULL,
  parinit = NULL,
  multistart = 1,
  control = NULL,
  gr = TRUE,
  iso = FALSE,
  scaling = FALSE,
  knots = NULL,
  kernel = NULL,
  ...
)

```

**Arguments**

formula	R formula object to setup the linear trend in Universal Kriging. Supports ~ 1, ~. and ~ .^2.
design	Data frame. The design of experiments.
response	Vector of output values.
covtype	Covariance structure. For now all the kernels are tensor product kernels.
coef.trend	Optional value for a fixed vector of trend coefficients. If given, no optimization is done.

<code>coef.cov</code>	Optional value for a fixed correlation range value. If given, no optimization is done.
<code>coef.var</code>	Optional value for a fixed variance. If given, no optimization is done.
<code>nugget, nugget.estim, noise.var</code>	Not implemented yet.
<code>estim.method</code>	Estimation criterion. "MLE" for Maximum-Likelihood or "LOO" for Leave-One-Out cross-validation.
<code>penalty</code>	Not implemented yet.
<code>optim.method</code>	Optimization algorithm used in the optimization of the objective given in <code>estim.method</code> . Supports "BFGS".
<code>lower, upper</code>	Not implemented yet.
<code>parinit</code>	Initial values for the correlation ranges which will be optimized using <code>optim.method</code> .
<code>multistart, control, gr, iso</code>	Not implemented yet.
<code>scaling, knots, kernel</code>	Not implemented yet.
<code>...</code>	Ignored.

### Details

The class "KM" extends the "km" class of the **DiceKriging** package, hence has all slots of "km". It also has an extra slot "Kriging" slot which contains a copy of the original object.

### Value

A KM object. See **Details**.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

[km](#) in the **DiceKriging** package for more details on the slots.

### Examples

```
# a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- as.matrix(expand.grid(x1 = seq(0, 1, length = 4),
                                   x2 = seq(0, 1, length = 4)))
y <- apply(design.fact, 1, DiceKriging::branin)

# Using `km` from DiceKriging and a similar `KM` object
# kriging model 1 : matern5_2 covariance structure, no trend, no nugget effect
km1 <- DiceKriging::km(design = design.fact, response = y, covtype = "gauss",
                      parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- KM(design = design.fact, response = y, covtype = "gauss",
```

```
parinit = c(.5, 1))
```

---

 KM-class

*S4 class for Kriging Models Extending the "km" Class*

---

### Description

This class is intended to be used either by using its own dedicated S4 methods or by using the S4 methods inherited from the "km" class of the **libKriging** package.

### Slots

`d, n, X, y, p, F` Number of (numeric) inputs, number of observations, design matrix, response vector, number of trend variables, trend matrix.

`trend.formula, trend.coef` Formula used for the trend, vector  $\hat{\beta}$  of estimated (or fixed) trend coefficients with length  $p$ .

`covariance` A S4 object with class "covTensorProduct" representing a covariance kernel.

`noise.flag, noise.var` Logical flag and numeric value for an optional noise term.

`known.param` A character code indicating what parameters are known.

`lower, upper` Bounds on the correlation range parameters.

`method, penalty, optim.method, control, gr, parinit` Objects defining the estimation criterion, the optimization.

`T, M, z` Auxiliary variables (matrices and vectors) that can be used in several computations.

`case` The possible concentration (a.k.a. profiling) of the likelihood.

`param.estim` Logical. Is an estimation used?

`Kriging` A copy of the Kriging object used to create the current KM object.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

[km-class](#) in the **DiceKriging** package. The creator [KM](#).

---

Kriging                      *Create an object with S3 class "Kriging" using the **libKriging** library.*

---

### Description

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by objective, using the method given in optim.

### Usage

```
Kriging(
  y = NULL,
  X = NULL,
  kernel = NULL,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "Newton", "none"),
  objective = c("LL", "LOO", "LMP"),
  parameters = NULL
)
```

### Arguments

y	Numeric vector of response values.
X	Numeric matrix of input design.
kernel	Character defining the covariance model: "exp", "gauss", "matern3_2", "matern5_2".
regmodel	Universal Kriging linear trend: "constant", "linear", "interactive", "quadratic".
normalize	Logical. If TRUE both the input matrix X and the response y in normalized to take values in the interval [0, 1].
optim	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS", "Newton" and "none", the later simply keeping the values given in parameters. The method "BFGS" uses the gradient of the objective (note that "BGFS10" means 10 multi-start of BFGS). The method "Newton" uses both the gradient and the Hessian of the objective.
objective	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood, "LOO" for the Leave-One-Out sum of squares and "LMP" for the Log-Marginal Posterior.
parameters	Initial values for the hyper-parameters. When provided this must be named list with elements "sigma2" and "theta" containing the initial value(s) for the variance and for the range parameters. If theta is a matrix with more than one row, each row is used as a starting point for optimization.

### Value

An object with S3 class "Kriging". Should be used with its predict, simulate, update methods.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)
## fit and print
k <- Kriging(y, X, kernel = "matern3_2")
print(k)

x <- as.matrix(seq(from = 0, to = 1, length.out = 101))
p <- predict(k, x = x, return_stdev = TRUE, return_cov = FALSE)

plot(f)
points(X, y)
lines(x, p$mean, col = "blue")
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
border = NA, col = rgb(0, 0, 1, 0.2))

s <- simulate(k, nsim = 10, seed = 123, x = x)

matlines(x, s, col = rgb(0, 0, 1, 0.2), type = "l", lty = 1)
```

---

leaveOneOut

*Compute Leave-One-Out*

---

**Description**

Compute the leave-One-Out error of a model given in object.

**Usage**

```
leaveOneOut(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Ignored.

**Value**

The Leave-One-Out sum of squares.

---

leaveOneOut.Kriging    *Get leaveOneOut of Kriging Model*

---

**Description**

Get leaveOneOut of Kriging Model

**Usage**

```
## S3 method for class 'Kriging'  
leaveOneOut(object, ...)
```

**Arguments**

object            An S3 Kriging object.  
...                Not used.

**Value**

The leaveOneOut computed for fitted *theta*.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)  
set.seed(123)  
X <- as.matrix(runif(10))  
y <- f(X)  
  
k <- Kriging(y, X, kernel = "matern3_2", objective="L00")  
print(k)  
  
leaveOneOut(k)
```

---

leaveOneOutFun            *Leave-One-Out function*

---

**Description**

Compute the leave-One-Out error of a model given in object, at a different value of the parameters.

**Usage**

```
leaveOneOutFun(object, ...)
```

**Arguments**

object            An object representing a fitted model.  
 ...              Further arguments of function (eg. range).

**Value**

The Leave-One-Out sum of squares.

---

leaveOneOutFun.Kriging

*Compute Leave-One-Out (LOO) error for an object with S3 class "Kriging" representing a kriging model.*

---

**Description**

The returned value is the sum of squares  $\sum_{i=1}^n [y_i - \hat{y}_{i,(-i)}]^2$  where  $\hat{y}_{i,(-i)}$  is the prediction of  $y_i$  based on the the observations  $y_j$  with  $j \neq i$ .

**Usage**

```
## S3 method for class 'Kriging'
leaveOneOutFun(object, theta, return_grad = FALSE, bench = FALSE, ...)
```

**Arguments**

object            A Kriging object.  
 theta             A numeric vector of range parameters at which the LOO will be evaluated.  
 return\_grad      Logical. Should the gradient (w.r.t. theta) be returned?  
 bench             Logical. Should the function display benchmarking output  
 ...               Not used.

**Value**

The leave-One-Out value computed for the given vector  $\theta$  of correlation ranges.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2", objective = "LOO", optim="BFGS")
print(k)

loo <- function(theta) leaveOneOutFun(k, theta)$leaveOneOut
t <- seq(from = 0.001, to = 2, length.out = 101)
plot(t, loo(t), type = "l")
abline(v = k$theta(), col = "blue")
```

---

leaveOneOutVec	<i>Leave-One-Out vector</i>
----------------	-----------------------------

---

**Description**

Compute the leave-One-Out vector error of a model given in object, at a different value of the parameters.

**Usage**

```
leaveOneOutVec(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Further arguments of function (eg. range).

**Value**

The Leave-One-Out errors (mean and stdev) for each conditional point.

---

```
leaveOneOutVec.Kriging
```

*Compute Leave-One-Out (LOO) vector error for an object with S3 class "Kriging" representing a kriging model.*

---

**Description**

The returned value is the mean and stdev of  $\hat{y}_{i,(-i)}$ , the prediction of  $y_i$  based on the the observations  $y_j$  with  $j \neq i$ .

**Usage**

```
## S3 method for class 'Kriging'
leaveOneOutVec(object, theta, ...)
```

**Arguments**

object	A Kriging object.
theta	A numeric vector of range parameters at which the LOO will be evaluated.
...	Not used.

**Value**

The leave-One-Out vector computed for the given vector  $\theta$  of correlation ranges.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(c(0.0, 0.25, 0.5, 0.75, 1.0))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2")
print(k)

x <- as.matrix(seq(0, 1, , 101))
p <- predict(k, x, TRUE, FALSE)

plot(f)
points(X, y)
lines(x, p$mean, col = 'blue')
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
        border = NA, col = rgb(0, 0, 1, 0.2))

# Compute leave-one-out (no range re-estimate) on 2nd point
X_no2 = X[-2,,drop=FALSE]
y_no2 = f(X_no2)
k_no2 = Kriging(y_no2, X_no2, "matern3_2", optim = "none", parameters = list(theta = k$theta()))
print(k_no2)

p_no2 <- predict(k_no2, x, TRUE, FALSE)
lines(x, p_no2$mean, col = 'red')
polygon(c(x, rev(x)), c(p_no2$mean - 2 * p_no2$stdev, rev(p_no2$mean + 2 * p_no2$stdev)),
        border = NA, col = rgb(1, 0, 0, 0.2))

# Use leaveOneOutVec to get the same
loov = k$leaveOneOutVec(matrix(k$theta()))
points(X[2], loov$mean[2], col='red')
```

```
lines(rep(X[2],2),loov$mean[2]+2*c(-loov$stdev[2],loov$stdev[2]),col='red')
```

---

load	<i>Load any Kriging Model from a file storage.</i>
------	--

---

### Description

Load any Kriging Model from a file storage.

### Usage

```
load(filename, ...)
```

### Arguments

filename	A file holding any Kriging object.
...	Not used.

### Value

The loaded "\*"Kriging object.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2", objective="LMP")
print(k)

outfile = tempfile("k.json")
save(k,outfile)

print(load(outfile))
```

---

load.Kriging	<i>Load a Kriging Model from a file storage</i>
--------------	---

---

**Description**

Load a Kriging Model from a file storage

**Usage**

```
load.Kriging(filename, ...)
```

**Arguments**

filename	File name to load from.
...	Not used.

**Value**

The loaded Kriging object.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

```

---

logLikelihoodFun	<i>Log-Likelihood function</i>
------------------	--------------------------------

---

**Description**

Compute the log-Likelihood of a model given in object, at a different value of the parameters.

**Usage**

```
logLikelihoodFun(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Further arguments of function (eg. range).

**Value**

The log-likelihood.

---

logLikelihoodFun.Kriging	<i>Compute Log-Likelihood of Kriging Model</i>
--------------------------	--

---

**Description**

Compute Log-Likelihood of Kriging Model

**Usage**

```
## S3 method for class 'Kriging'  
logLikelihoodFun(  
  object,  
  theta,  
  return_grad = FALSE,  
  return_hess = FALSE,  
  bench = FALSE,  
  ...  
)
```

**Arguments**

object	An S3 Kriging object.
theta	A numeric vector of (positive) range parameters at which the log-likelihood will be evaluated.
return_grad	Logical. Should the function return the gradient?
return_hess	Logical. Should the function return Hessian?
bench	Logical. Should the function display benchmarking output?
...	Not used.

**Value**

The log-Likelihood computed for given *theta*.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2")
print(k)

ll <- function(theta) logLikelihoodFun(k, theta)$logLikelihood

t <- seq(from = 0.001, to = 2, length.out = 101)
plot(t, ll(t), type = 'l')
abline(v = k$theta(), col = "blue")
```

---

s2 <- seq(from = 0.001, to = 1, length.out = 31)
t <- seq(from = 0.001, to = 2, length.out = 31)
contour(t,s2,matrix(ncol=length(s2),ll(expand.grid(t,s2))),xlab="theta",ylab="sigma2")
points(k$theta(),k$sigma2(),col='blue')
```

---

 logLikelihoodFun.NuggetKriging

*Compute Log-Likelihood of NuggetKriging Model*

---

## Description

Compute Log-Likelihood of NuggetKriging Model

## Usage

```
## S3 method for class 'NuggetKriging'
logLikelihoodFun(object, theta_alpha, return_grad = FALSE, bench = FALSE, ...)
```

## Arguments

object	An S3 NuggetKriging object.
theta_alpha	A numeric vector of (positive) range parameters and variance over variance plus nugget at which the log-likelihood will be evaluated.
return_grad	Logical. Should the function return the gradient?
bench	Logical. Should the function display benchmarking output
...	Not used.

## Value

The log-Likelihood computed for given *theta\_alpha*.

## Author(s)

Yann Richet <yann.richet@irsn.fr>

## Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))

k <- NuggetKriging(y, X, kernel = "matern3_2")
print(k)

theta0 = k$theta()
ll_alpha <- function(alpha) logLikelihoodFun(k, cbind(theta0, alpha))$logLikelihood
a <- seq(from = 0.9, to = 1.0, length.out = 101)
plot(a, Vectorize(ll_alpha)(a), type = "l", xlim=c(0.9,1))
abline(v = k$sigma2()/(k$sigma2()+k$nugget()), col = "blue")

alpha0 = k$sigma2()/(k$sigma2()+k$nugget())
ll_theta <- function(theta) logLikelihoodFun(k, cbind(theta, alpha0))$logLikelihood
```

```

t <- seq(from = 0.001, to = 2, length.out = 101)
plot(t, Vectorize(ll_theta)(t), type = 'l')
abline(v = k$theta(), col = "blue")

ll <- function(theta_alpha) logLikelihoodFun(k, theta_alpha)$logLikelihood
a <- seq(from = 0.9, to = 1.0, length.out = 31)
t <- seq(from = 0.001, to = 2, length.out = 101)
contour(t,a,matrix(ncol=length(a),ll(expand.grid(t,a))),xlab="theta",ylab="sigma2/(sigma2+nugget)")
points(k$theta(),k$sigma2()/(k$sigma2()+k$nugget()),col='blue')

```

---

logMargPost

---

*Compute log-Marginal Posterior*

---

### Description

Compute the log-Marginal Posterior of a model given in object.

### Usage

```
logMargPost(object, ...)
```

### Arguments

object	An object representing a fitted model.
...	Ignored.

### Value

The log-marginal posterior.

---

logMargPost.Kriging

---

*Get logMargPost of Kriging Model*

---

### Description

Get logMargPost of Kriging Model

### Usage

```
## S3 method for class 'Kriging'
logMargPost(object, ...)
```

### Arguments

object	An S3 Kriging object.
...	Not used.

**Value**

The logMargPost computed for fitted *theta*.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)

k <- Kriging(y, X, kernel = "matern3_2", objective="LMP")
print(k)

logMargPost(k)
```

---

logMargPost.NuggetKriging

*Get logMargPost of NuggetKriging Model*

---

**Description**

Get logMargPost of NuggetKriging Model

**Usage**

```
## S3 method for class 'NuggetKriging'
logMargPost(object, ...)
```

**Arguments**

object	An S3 NuggetKriging object.
...	Not used.

**Value**

The logMargPost computed for fitted *theta<sub>alpha</sub>*.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))

k <- NuggetKriging(y, X, kernel = "matern3_2", objective="LMP")
print(k)

logMargPost(k)
```

---

logMargPostFun	<i>log-Marginal Posterior function</i>
----------------	--

---

**Description**

Compute the log-Marginal Posterior of a model given in object, at a different value of the parameters.

**Usage**

```
logMargPostFun(object, ...)
```

**Arguments**

object	An object representing a fitted model.
...	Further arguments of function (eg. range).

**Value**

The log-marginal posterior.

---

logMargPostFun.Kriging	<i>Compute the log-marginal posterior of a kriging model, using the prior XXXY.</i>
------------------------	---

---

**Description**

Compute the log-marginal posterior of a kriging model, using the prior XXXY.

**Usage**

```
## S3 method for class 'Kriging'
logMargPostFun(object, theta, return_grad = FALSE, bench = FALSE, ...)
```

**Arguments**

object	S3 Kriging object.
theta	Numeric vector of correlation range parameters at which the function is to be evaluated.
return_grad	Logical. Should the function return the gradient (w.r.t theta)?
bench	Logical. Should the function display benchmarking output?
...	Not used.

**Value**

The value of the log-marginal posterior computed for the given vector theta.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

---

NoiseKM

---

*Create an NoiseKM Object*

---

## Description

Create an object of S4 class "NoiseKM" similar to a km object in the **DiceKriging** package.

## Usage

```

NoiseKM(
  formula = ~1,
  design,
  response,
  covtype = c("matern5_2", "gauss", "matern3_2", "exp"),
  coef.trend = NULL,
  coef.cov = NULL,
  coef.var = NULL,
  nugget = NULL,
  nugget.estim = FALSE,
  noise.var,
  estim.method = c("MLE", "LOO"),
  penalty = NULL,
  optim.method = "BFGS",
  lower = NULL,
  upper = NULL,
  parinit = NULL,
  multistart = 1,
  control = NULL,

```

```

    gr = TRUE,
    iso = FALSE,
    scaling = FALSE,
    knots = NULL,
    kernel = NULL,
    ...
)

```

### Arguments

formula	R formula object to setup the linear trend in Universal NoiseKriging. Supports $\sim 1$ , $\sim \cdot$ , and $\sim \cdot^2$ .
design	Data frame. The design of experiments.
response	Vector of output values.
covtype	Covariance structure. For now all the kernels are tensor product kernels.
coef.trend	Optional value for a fixed vector of trend coefficients. If given, no optimization is done.
coef.cov	Optional value for a fixed correlation range value. If given, no optimization is done.
coef.var	Optional value for a fixed variance. If given, no optimization is done.
nugget, nugget.estim	Not implemented.
noise.var	Vector of output values variance.
estim.method	Estimation criterion. "MLE" for Maximum-Likelihood or "LOO" for Leave-One-Out cross-validation.
penalty	Not implemented yet.
optim.method	Optimization algorithm used in the optimization of the objective given in estim.method. Supports "BFGS".
lower, upper	Not implemented yet.
parinit	Initial values for the correlation ranges which will be optimized using optim.method.
multistart, control, gr, iso	Not implemented yet.
scaling, knots, kernel	Not implemented yet.
...	Ignored.

### Details

The class "NoiseKM" extends the "km" class of the **DiceKriging** package, hence has all slots of "km". It also has an extra slot "NoiseKriging" slot which contains a copy of the original object.

### Value

A NoiseKM object. See **Details**.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**See Also**

[km](#) in the **DiceKriging** package for more details on the slots.

**Examples**

```
# a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- as.matrix(expand.grid(x1 = seq(0, 1, length = 4),
                                   x2 = seq(0, 1, length = 4)))
y <- apply(design.fact, 1, DiceKriging::branin) + rnorm(nrow(design.fact))

# Using `km` from DiceKriging and a similar `NoiseKM` object
# kriging model 1 : matern5_2 covariance structure, no trend, no nugget effect
km1 <- DiceKriging::km(design = design.fact, response = y, covtype = "gauss",
                      noise.var=rep(1,nrow(design.fact)),
                      parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- NoiseKM(design = design.fact, response = y, covtype = "gauss",
              noise=rep(1,nrow(design.fact)), parinit = c(.5, 1))
```

---

NoiseKM-class

*S4 class for NoiseKriging Models Extending the "km" Class*

---

**Description**

This class is intended to be used either by using its own dedicated S4 methods or by using the S4 methods inherited from the "km" class of the **libKriging** package.

**Slots**

`d, n, X, y, p, F` Number of (numeric) inputs, number of observations, design matrix, response vector, number of trend variables, trend matrix.

`trend.formula, trend.coef` Formula used for the trend, vector  $\hat{\beta}$  of estimated (or fixed) trend coefficients with length  $p$ .

`covariance` A S4 object with class "covTensorProduct" representing a covariance kernel.

`noise.flag, noise.var` Logical flag and numeric value for an optional noise term.

`known.param` A character code indicating what parameters are known.

`lower, upper` Bounds on the correlation range parameters.

`method, penalty, optim.method, control, gr, parinit` Objects defining the estimation criterion, the optimization.

`T, M, z` Auxiliary variables (matrices and vectors) that can be used in several computations.

`case` The possible concentration (a.k.a. profiling) of the likelihood.

`param.estim` Logical. Is an estimation used?

`NoiseKriging` A copy of the NoiseKriging object used to create the current NoiseKM object.

**Author(s)**

---

NoiseKriging	<i>Create an object with S3 class "NoiseKriging" using the <b>libKriging</b> library.</i>
--------------	---

---

**Description**

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by objective, using the method given in optim.

**Usage**

```
NoiseKriging(
  y = NULL,
  noise = NULL,
  X = NULL,
  kernel = NULL,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "none"),
  objective = c("LL"),
  parameters = NULL
)
```

**Arguments**

y	Numeric vector of response values.
noise	Numeric vector of response variances.
X	Numeric matrix of input design.
kernel	Character defining the covariance model: "exp", "gauss", "matern3_2", "matern5_2".
regmodel	Universal NoiseKriging "linear", "interactive", "quadratic".
normalize	Logical. If TRUE both the input matrix X and the response y in normalized to take values in the interval [0, 1].
optim	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS" and "none", the later simply keeping the values given in parameters. The method "BFGS" uses the gradient of the objective (note that "BFGS10" means 10 multi-start of BFGS).
objective	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood.

**parameters** Initial values for the hyper-parameters. When provided this must be named list with elements "sigma2" and "theta" containing the initial value(s) for the variance and for the range parameters. If theta is a matrix with more than one row, each row is used as a starting point for optimization.

### Value

An object with S3 class "NoiseKriging". Should be used with its predict, simulate, update methods.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + X/10 * rnorm(nrow(X)) # add noise dep. on X
## fit and print
k <- NoiseKriging(y, noise=(X/10)^2, X, kernel = "matern3_2")
print(k)

x <- as.matrix(seq(from = 0, to = 1, length.out = 101))
p <- predict(k,x = x, return_stdev = TRUE, return_cov = FALSE)

plot(f)
points(X, y)
lines(x, p$mean, col = "blue")
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
border = NA, col = rgb(0, 0, 1, 0.2))

s <- simulate(k, nsim = 10, seed = 123, x = x)

matlines(x, s, col = rgb(0, 0, 1, 0.2), type = "l", lty = 1)
```

---

NuggetKM

*Create an NuggetKM Object*

---

### Description

Create an object of S4 class "NuggetKM" similar to a km object in the **DiceKriging** package.

### Usage

```
NuggetKM(
  formula = ~1,
  design,
```

```

response,
covtype = c("matern5_2", "gauss", "matern3_2", "exp"),
coef.trend = NULL,
coef.cov = NULL,
coef.var = NULL,
nugget = NULL,
nugget.estim = TRUE,
noise.var = NULL,
estim.method = c("MLE", "LOO"),
penalty = NULL,
optim.method = "BFGS",
lower = NULL,
upper = NULL,
parinit = NULL,
multistart = 1,
control = NULL,
gr = TRUE,
iso = FALSE,
scaling = FALSE,
knots = NULL,
kernel = NULL,
...
)

```

### Arguments

formula	R formula object to setup the linear trend in Universal NuggetKriging. Supports $\sim 1$ , $\sim \cdot$ , and $\sim \cdot^2$ .
design	Data frame. The design of experiments.
response	Vector of output values.
covtype	Covariance structure. For now all the kernels are tensor product kernels.
coef.trend	Optional value for a fixed vector of trend coefficients. If given, no optimization is done.
coef.cov	Optional value for a fixed correlation range value. If given, no optimization is done.
coef.var	Optional value for a fixed variance. If given, no optimization is done.
nugget.estim, nugget	Should nugget be estimated? (defaults TRUE) or given values.
noise.var	Not implemented.
estim.method	Estimation criterion. "MLE" for Maximum-Likelihood or "LOO" for Leave-One-Out cross-validation.
penalty	Not implemented yet.
optim.method	Optimization algorithm used in the optimization of the objective given in estim.method. Supports "BFGS".
lower, upper	Not implemented yet.

parinit            Initial values for the correlation ranges which will be optimized using `optim.method`.  
multistart, control, gr, iso  
                  Not implemented yet.  
scaling, knots, kernel  
                  Not implemented yet.  
...                Ignored.

### Details

The class "NuggetKM" extends the "km" class of the **DiceKriging** package, hence has all slots of "km". It also has an extra slot "NuggetKriging" slot which contains a copy of the original object.

### Value

A NuggetKM object. See **Details**.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

[km](#) in the **DiceKriging** package for more details on the slots.

### Examples

```
# a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- as.matrix(expand.grid(x1 = seq(0, 1, length = 4),
                                   x2 = seq(0, 1, length = 4)))
y <- apply(design.fact, 1, DiceKriging::branin) + rnorm(nrow(design.fact))

# Using `km` from DiceKriging and a similar `NuggetKM` object
# kriging model 1 : matern5_2 covariance structure, no trend, no nugget effect
km1 <- DiceKriging::km(design = design.fact, response = y, covtype = "gauss",
                      nugget.estim=TRUE,
                      parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- NuggetKM(design = design.fact, response = y, covtype = "gauss",
               parinit = c(.5, 1))
```

---

NuggetKM-class

*S4 class for NuggetKriging Models Extending the "km" Class*

---

### Description

This class is intended to be used either by using its own dedicated S4 methods or by using the S4 methods inherited from the "km" class of the **libKriging** package.

**Slots**

`d, n, X, y, p, F` Number of (numeric) inputs, number of observations, design matrix, response vector, number of trend variables, trend matrix.

`trend.formula, trend.coef` Formula used for the trend, vector  $\hat{\beta}$  of estimated (or fixed) trend coefficients with length  $p$ .

`covariance` A S4 object with class "covTensorProduct" representing a covariance kernel.

`noise.flag, noise.var` Logical flag and numeric value for an optional noise term.

`known.param` A character code indicating what parameters are known.

`lower, upper` Bounds on the correlation range parameters.

`method, penalty, optim.method, control, gr, par.init` Objects defining the estimation criterion, the optimization.

`T, M, z` Auxiliary variables (matrices and vectors) that can be used in several computations.

`case` The possible concentration (a.k.a. profiling) of the likelihood.

`param.estim` Logical. Is an estimation used?

`NuggetKriging` A copy of the `NuggetKriging` object used to create the current `NuggetKM` object.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

---

NuggetKriging	<i>Create an object with S3 class "NuggetKriging" using the <b>libKriging</b> library.</i>
---------------	--

---

**Description**

The hyper-parameters (variance and vector of correlation ranges) are estimated thanks to the optimization of a criterion given by `objective`, using the method given in `optim`.

**Usage**

```
NuggetKriging(
  y = NULL,
  X = NULL,
  kernel = NULL,
  regmodel = c("constant", "linear", "interactive", "none"),
  normalize = FALSE,
  optim = c("BFGS", "none"),
  objective = c("LL", "LMP"),
  parameters = NULL
)
```

**Arguments**

<code>y</code>	Numeric vector of response values.
<code>X</code>	Numeric matrix of input design.
<code>kernel</code>	Character defining the covariance model: "exp", "gauss", "matern3_2", "matern5_2".
<code>regmodel</code>	Universal NuggetKriging "linear", "interactive", "quadratic".
<code>normalize</code>	Logical. If TRUE both the input matrix <code>X</code> and the response <code>y</code> in normalized to take values in the interval $[0, 1]$ .
<code>optim</code>	Character giving the Optimization method used to fit hyper-parameters. Possible values are: "BFGS" and "none", the later simply keeping the values given in parameters. The method "BFGS" uses the gradient of the objective (note that "BGFS10" means 10 multi-start of BFGS).
<code>objective</code>	Character giving the objective function to optimize. Possible values are: "LL" for the Log-Likelihood and "LMP" for the Log-Marginal Posterior.
<code>parameters</code>	Initial values for the hyper-parameters. When provided this must be named list with some elements "sigma2", "theta", "nugget" containing the initial value(s) for the variance, range and nugget parameters. If theta is a matrix with more than one row, each row is used as a starting point for optimization.

**Value**

An object with S3 class "NuggetKriging". Should be used with its predict, simulate, update methods.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))
## fit and print
k <- NuggetKriging(y, X, kernel = "matern3_2")
print(k)

x <- sort(c(X,as.matrix(seq(from = 0, to = 1, length.out = 101))))
p <- predict(k, x = x, return_stdev = TRUE, return_cov = FALSE)

plot(f)
points(X, y)
lines(x, p$mean, col = "blue")
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
border = NA, col = rgb(0, 0, 1, 0.2))

s <- simulate(k, nsim = 10, seed = 123, x = x)

matlines(x, s, col = rgb(0, 0, 1, 0.2), type = "l", lty = 1)
```

---

predict, KM-method      *Prediction Method for a KM Object*

---

### Description

Compute predictions for the response at new given input points. These conditional mean, the conditional standard deviation and confidence limits at the 95% level. Optionnally the conditional covariance can be returned as well.

### Usage

```
## S4 method for signature 'KM'
predict(
  object,
  newdata,
  type = "UK",
  se.compute = TRUE,
  cov.compute = FALSE,
  light.return = TRUE,
  bias.correct = FALSE,
  checkNames = FALSE,
  ...
)
```

### Arguments

<code>object</code>	KM object.
<code>newdata</code>	Matrix of "new" input points where to perform prediction.
<code>type</code>	character giving the kriging type. For now only "UK" is possible.
<code>se.compute</code>	Logical. Should the standard error be computed?
<code>cov.compute</code>	Logical. Should the covariance matrix between newdata points be computed?
<code>light.return</code>	Logical. If TRUE, no auxiliary results will be returned (such as the Cholesky root of the correlation matrix).
<code>bias.correct</code>	Logical. If TRUE the UK variance and covariance are .
<code>checkNames</code>	Logical to check the consistency of the column names between the design stored in <code>object@X</code> and the new one given <code>newdata</code> .
<code>...</code>	Ignored.

### Details

Without a dedicated `predict` method for the class "KM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a KM object to a km object with `as.km` before calling `predict`.

**Value**

A named list. The elements are the conditional mean and standard deviation (mean and sd), the predicted trend (trend) and the confidence limits (lower95 and upper95). Optionnally, the conditional covariance matrix is returned in cov.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
## a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- expand.grid(x1 = seq(0, 1, length = 4), x2 = seq(0, 1, length = 4))
y <- apply(design.fact, 1, DiceKriging::branin)

## library(DiceKriging)
## kriging model 1 : matern5_2 covariance structure, no trend, no nugget
## m1 <- km(design = design.fact, response = y, covtype = "gauss",
##         parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- KM(design = design.fact, response = y, covtype = "gauss",
         parinit = c(.5, 1))
Pred <- predict(KM1, newdata = matrix(.5, ncol = 2), type = "UK",
              checkNames = FALSE, light.return = TRUE)
```

---

predict,NoiseKM-method

*Prediction Method for a NoiseKM Object*

---

**Description**

Compute predictions for the response at new given input points. These conditional mean, the conditional standard deviation and confidence limits at the 95% level. Optionnally the conditional covariance can be returned as well.

**Usage**

```
## S4 method for signature 'NoiseKM'
predict(
  object,
  newdata,
  type = "UK",
  se.compute = TRUE,
  cov.compute = FALSE,
  light.return = TRUE,
  bias.correct = FALSE,
  checkNames = FALSE,
```

```
    ...
  )
```

### Arguments

object	NoiseKM object.
newdata	Matrix of "new" input points where to perform prediction.
type	character giving the kriging type. For now only "UK" is possible.
se.compute	Logical. Should the standard error be computed?
cov.compute	Logical. Should the covariance matrix between newdata points be computed?
light.return	Logical. If TRUE, no auxiliary results will be returned (such as the Cholesky root of the correlation matrix).
bias.correct	Logical. If TRUE the UK variance and covariance are .
checkNames	Logical to check the consistency of the column names between the design stored in object@X and the new one given newdata.
...	Ignored.

### Details

Without a dedicated predict method for the class "NoiseKM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a NoiseKM object to a km object with [as.km](#) before calling predict.

### Value

A named list. The elements are the conditional mean and standard deviation (mean and sd), the predicted trend (trend) and the confidence limits (lower95 and upper95). Optionnally, the conditional covariance matrix is returned in cov.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
## a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- expand.grid(x1 = seq(0, 1, length = 4), x2 = seq(0, 1, length = 4))
y <- apply(design.fact, 1, DiceKriging::branin) + rnorm(nrow(design.fact))

## library(DiceKriging)
## kriging model 1 : matern5_2 covariance structure, no trend, no nugget
## m1 <- km(design = design.fact, response = y, covtype = "gauss",
##         noise.var=rep(1,nrow(design.fact)),
##         parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- NoiseKM(design = design.fact, response = y, covtype = "gauss",
              noise=rep(1,nrow(design.fact)),
              parinit = c(.5, 1))
```

```
Pred <- predict(KM1, newdata = matrix(.5,ncol = 2), type = "UK",
               checkNames = FALSE, light.return = TRUE)
```

---

predict,NuggetKM-method

*Prediction Method for a NuggetKM Object*

---

### Description

Compute predictions for the response at new given input points. These conditional mean, the conditional standard deviation and confidence limits at the 95% level. Optionnally the conditional covariance can be returned as well.

### Usage

```
## S4 method for signature 'NuggetKM'
predict(
  object,
  newdata,
  type = "UK",
  se.compute = TRUE,
  cov.compute = FALSE,
  light.return = TRUE,
  bias.correct = FALSE,
  checkNames = FALSE,
  ...
)
```

### Arguments

object	NuggetKM object.
newdata	Matrix of "new" input points where to perform prediction.
type	character giving the kriging type. For now only "UK" is possible.
se.compute	Logical. Should the standard error be computed?
cov.compute	Logical. Should the covariance matrix between newdata points be computed?
light.return	Logical. If TRUE, no auxiliary results will be returned (such as the Cholesky root of the correlation matrix).
bias.correct	Logical. If TRUE the UK variance and covariance are .
checkNames	Logical to check the consistency of the column names between the design stored in object@X and the new one given newdata.
...	Ignored.

**Details**

Without a dedicated predict method for the class "NuggetKM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a NuggetKM object to a km object with `as.km` before calling predict.

**Value**

A named list. The elements are the conditional mean and standard deviation (mean and sd), the predicted trend (trend) and the confidence limits (lower95 and upper95). Optionnally, the conditional covariance matrix is returned in cov.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
## a 16-points factorial design, and the corresponding response
d <- 2; n <- 16
design.fact <- expand.grid(x1 = seq(0, 1, length = 4), x2 = seq(0, 1, length = 4))
y <- apply(design.fact, 1, DiceKriging::branin) + rnorm(nrow(design.fact))

## library(DiceKriging)
## kriging model 1 : matern5_2 covariance structure, no trend, no nugget
## m1 <- km(design = design.fact, response = y, covtype = "gauss",
##         nugget.estim=TRUE,
##         parinit = c(.5, 1), control = list(trace = FALSE))
KM1 <- NuggetKM(design = design.fact, response = y, covtype = "gauss",
               parinit = c(.5, 1))
Pred <- predict(KM1, newdata = matrix(.5, ncol = 2), type = "UK",
               checkNames = FALSE, light.return = TRUE)
```

---

predict.Kriging	<i>Predict from a Kriging object.</i>
-----------------	---------------------------------------

---

**Description**

Given "new" input points, the method compute the expectation, variance and (optionnally) the covariance of the corresponding stochastic process, conditional on the values at the input points used when fitting the model.

**Usage**

```
## S3 method for class 'Kriging'
predict(
  object,
  x,
```

```

    return_stdev = TRUE,
    return_cov = FALSE,
    return_deriv = FALSE,
    ...
  )

```

### Arguments

object	S3 Kriging object.
x	Input points where the prediction must be computed.
return_stdev	Logical. If TRUE the standard deviation is returned.
return_cov	Logical. If TRUE the covariance matrix of the predictions is returned.
return_deriv	Logical. If TRUE the derivatives of mean and sd of the predictions are returned.
...	Ignored.

### Value

A list containing the element mean and possibly stdev and cov.

### Note

The names of the formal arguments differ from those of the predict methods for the S4 classes "km" and "KM". The formal x corresponds to newdata, stdev corresponds to se.compute and cov to cov.compute. These names are chosen **Python** and **Octave** interfaces to **libKriging**.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```

f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)
points(X, y, col = "blue", pch = 16)

k <- Kriging(y, X, "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
p <- predict(k, x)

lines(x, p$mean, col = "blue")
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
  border = NA, col = rgb(0, 0, 1, 0.2))

```

---

predict.NoiseKriging *Predict from a NoiseKriging object.*

---

### Description

Given "new" input points, the method compute the expectation, variance and (optionnally) the covariance of the corresponding stochastic process, conditional on the values at the input points used when fitting the model.

### Usage

```
## S3 method for class 'NoiseKriging'
predict(
  object,

save(k,outfile)
```

---

simulate,KM-method	<i>Simulation from a KM Object</i>
--------------------	------------------------------------

---

### Description

The simulate method is used to simulate paths from the kriging model described in object.

### Usage

```
## S4 method for signature 'KM'
simulate(
  object,
  nsim = 1,
  seed = NULL,
  newdata,
  cond = TRUE,
  nugget.sim = 0,
  checkNames = FALSE,
  ...
)
```

### Arguments

object	A KM object.
nsim	Integer: number of response vectors to simulate.
seed	Random seed.
newdata	Numeric matrix with it rows giving the points where the simulation is to be performed.
cond	Logical telling wether the simulation is conditional or not. Only TRUE is accepted for now.
nugget.sim	Numeric. A postive nugget effect used to avoid numerical instability.
checkNames	Check consistency between the design data X within object and newdata. The default is FALSE. XXXY Not used!!!
...	Ignored.

### Details

Without a dedicated simulate method for the class "KM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a KM object to a km object with [as.km](#) before calling simulate.

### Value

A numeric matrix with `nrow(newdata)` rows and `nsim` columns containing as its columns the simulated paths at the input points given in newdata.

XXX method simulate KM

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(5))
y <- f(X)
points(X, y, col = 'blue')
k <- KM(design = X, response = y, covtype = "gauss")
x <- seq(from = 0, to = 1, length.out = 101)
s_x <- simulate(k, nsim = 3, newdata = x)
lines(x, s_x[, 1], col = 'blue')
lines(x, s_x[, 2], col = 'blue')
lines(x, s_x[, 3], col = 'blue')
```

---

simulate,NoiseKM-method

*Simulation from a NoiseKM Object*

---

**Description**

The simulate method is used to simulate paths from the kriging model described in object.

**Usage**

```
## S4 method for signature 'NoiseKM'
simulate(
  object,
  nsim = 1,
  seed = NULL,
  newdata,
  cond = TRUE,
  nugget.sim = 0,
  checkNames = FALSE,
  ...
)
```

**Arguments**

object	A NoiseKM object.
nsim	Integer: number of response vectors to simulate.
seed	Random seed.

newdata	Numeric matrix with its rows giving the points where the simulation is to be performed.
cond	Logical telling whether the simulation is conditional or not. Only TRUE is accepted for now.
nugget.sim	Numeric. A positive nugget effect used to avoid numerical instability.
checkNames	Check consistency between the design data X within object and newdata. The default is FALSE. XXXY Not used!!!
...	Ignored.

### Details

Without a dedicated `simulate` method for the class "NoiseKM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a NoiseKM object to a km object with `as.km` before calling `simulate`.

### Value

A numeric matrix with `nrow(newdata)` rows and `nsim` columns containing as its columns the simulated paths at the input points given in `newdata`.

XXX method simulate NoiseKM

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(5))
y <- f(X) + 0.01*rnorm(nrow(X))
points(X, y, col = 'blue')

```

---

 simulate,NuggetKM-method

*Simulation from a NuggetKM Object*

---

### Description

The simulate method is used to simulate paths from the kriging model described in object.

### Usage

```
## S4 method for signature 'NuggetKM'
simulate(
  object,
  nsim = 1,
  seed = NULL,
  newdata,
  cond = TRUE,
  nugget.sim = 0,
  checkNames = FALSE,
  ...
)
```

### Arguments

object	A NuggetKM object.
nsim	Integer: number of response vectors to simulate.
seed	Random seed.
newdata	Numeric matrix with it rows giving the points where the simulation is to be performed.
cond	Logical telling wether the simulation is conditional or not. Only TRUE is accepted for now.
nugget.sim	Numeric. A postive nugget effect used to avoid numerical instability.
checkNames	Check consistency between the design data X within object and newdata. The default is FALSE. XXXY Not used!!!
...	Ignored.

### Details

Without a dedicated simulate method for the class "NuggetKM", this method would have been inherited from the "km" class. The dedicated method is expected to run faster. A comparison can be made by coercing a NuggetKM object to a km object with `as.km` before calling simulate.

### Value

A numeric matrix with `nrow(newdata)` rows and `nsim` columns containing as its columns the simulated paths at the input points given in newdata.

XXX method simulate NuggetKM

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(5))
y <- f(X) + 0.01*rnorm(nrow(X))
points(X, y, col = 'blue')

s_x <- simulate(k, nsim = 3, newdata = x)
lines(x, s_x[, 1], col = 'blue')
lines(x, s_x[, 2], col = 'blue')
lines(x, s_x[, 3], col = 'blue')
```

---

simulate.Kriging

*Simulation from a Kriging model object.*

---

**Description**

This method draws paths of the stochastic process at new input points conditional on the values at the input points used in the fit.

**Usage**

```
## S3 method for class 'Kriging'
simulate(object, nsim = 1, seed = 123, x, will_update = FALSE, ...)
```

**Arguments**

object	S3 Kriging object.
nsim	Number of simulations to perform.
seed	Random seed used.
x	Points in model input space where to simulate.
will_update	Set to TRUE if wish to use update_simulate(...) later.
...	Ignored.

**Value**

a matrix with `nrow(x)` rows and `nsim` columns containing the simulated paths at the inputs points given in `x`.

**Note**

The names of the formal arguments differ from those of the `simulate` methods for the S4 classes "km" and "KM". The formal `x` corresponds to `newdata`. These names are chosen **Python** and **Octave** interfaces to **libKriging**.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)

s <- simulate(k, nsim = 3, x = x)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")
```

---

`simulate.NoiseKriging` *Simulation from a NoiseKriging model object.*

---

**Description**

This method draws paths of the stochastic process at new input points conditional on the values at the input points used in the fit.

**Usage**

```
## S3 method for class 'NoiseKriging'
simulate(
  object,
  nsim = 1,
  seed = 123,
  x,
  with_noise = NULL,
  will_update = FALSE,
  ...
)
```

**Arguments**

object	S3 NoiseKriging object.
nsim	Number of simulations to perform.
seed	Random seed used.
x	Points in model input space where to simulate.
with_noise	Set to array of values if wish to add the noise in the simulation.
will_update	Set to TRUE if wish to use update_simulate(...) later.
...	Ignored.

**Value**

a matrix with `nrow(x)` rows and `nsim` columns containing the simulated paths at the inputs points given in `x`.

**Note**

The names of the formal arguments differ from those of the `simulate` methods for the S4 classes "km" and "KM". The formal `x` corresponds to `newdata`. These names are chosen **Python** and **Octave** interfaces to **libKriging**.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + X/10 * rnorm(nrow(X))
points(X, y, col = "blue")

k <- NoiseKriging(y, (X/10)^2, X, kernel = "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
s <- simulate(k, nsim = 3, x = x)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")
```

---

`simulate.NuggetKriging`*Simulation from a NuggetKriging model object.*

---

### Description

This method draws paths of the stochastic process at new input points conditional on the values at the input points used in the fit.

### Usage

```
## S3 method for class 'NuggetKriging'
simulate(
  object,
  nsim = 1,
  seed = 123,
  x,
  with_nugget = TRUE,
  will_update = FALSE,
  ...
)
```

### Arguments

<code>object</code>	S3 NuggetKriging object.
<code>nsim</code>	Number of simulations to perform.
<code>seed</code>	Random seed used.
<code>x</code>	Points in model input space where to simulate.
<code>with_nugget</code>	Set to FALSE if wish to remove the nugget in the simulation.
<code>will_update</code>	Set to TRUE if wish to use <code>update_simulate(...)</code> later.
<code>...</code>	Ignored.

### Value

a matrix with `nrow(x)` rows and `nsim` columns containing the simulated paths at the inputs points given in `x`.

### Note

The names of the formal arguments differ from those of the `simulate` methods for the S4 classes "km" and "KM". The formal `x` corresponds to `newdata`. These names are chosen **Python** and **Octave** interfaces to **libKriging**.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))
points(X, y, col = "blue")

k <- NuggetKriging(y, X, kernel = "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
s <- simulate(k, nsim = 3, x = x)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")
```

update,KM-method

*Update a KM Object with New Points***Description**

The update method is used when new observations are added to a fitted kriging model. Rather than fitting the model from scratch with the updated observations added, the results of the fit as stored in object are used to achieve some savings.

**Usage**

```
## S4 method for signature 'KM'
update(
  object,
  newX,
  newY,
  newX.alreadyExist = FALSE,
  cov.reestim = TRUE,
  trend.reestim = cov.reestim,
  nugget.reestim = FALSE,
  newnoise.var = NULL,
  kmcontrol = NULL,
  newF = NULL,
  ...
)
```

**Arguments**

object            A KM object.

<code>newX</code>	A numeric matrix containing the new design points. It must have <code>object@</code> columns in correspondence with those of the design matrix used to fit the model which is stored as <code>object@X</code> .
<code>newy</code>	A numeric vector of new response values, in correspondence with the rows of <code>newX</code> .
<code>newX.alreadyExist</code>	Logical. If TRUE, <code>newX</code> can contain some input points that are already in <code>object@X</code> .
<code>cov.reestim</code>	Logical. If TRUE, the vector <code>theta</code> of correlation ranges will be re-estimated using the new observations as well as the observations already used when fitting <code>object</code> . Only TRUE can be used for now.
<code>trend.reestim</code>	Logical. If TRUE the vector <code>beta</code> of trend coefficients will be re-estimated using all the observations. Only TRUE can be used for now.
<code>nugget.reestim</code>	Logical. If TRUE the nugget effect will be re-estimated using all the observations. Only FALSE can be used for now.
<code>newnoise.var</code>	Optional variance of an additional noise on the new response.
<code>kmcontrol</code>	A list of options to tune the fit. Not available yet.
<code>newF</code>	New trend matrix. XXXY?
<code>...</code>	Ignored.

### Details

Without a dedicated update method for the class "KM", this would have been inherited from the class "km". The dedicated method is expected to run faster. A comparison can be made by coercing a KM object to a km object with [as.km](#) before calling `update`.

### Value

The updated KM object.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

[as.km](#) to coerce a KM object to the class "km".

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(5))
y <- f(X)
points(X, y, col = "blue")
KMobj <- KM(design = X, response = y, covtype = "gauss")
x <- seq(from = 0, to = 1, length.out = 101)
```

```

p_x <- predict(KMobj, x)
lines(x, p_x$mean, col = "blue")
lines(x, p_x$lower95, col = "blue")
lines(x, p_x$upper95, col = "blue")
newX <- as.matrix(runif(3))
newy <- f(newX)
points(newX, newy, col = "red")

## replace the object by its updated version
KMobj <- update(KMobj, newX=newX, newy=newy)

x <- seq(from = 0, to = 1, length.out = 101)
p2_x <- predict(KMobj, x)
lines(x, p2_x$mean, col = "red")
lines(x, p2_x$lower95, col = "red")
lines(x, p2_x$upper95, col = "red")

```

---

update,NoiseKM-method *Update a NoiseKM Object with New Points*

---

### Description

The update method is used when new observations are added to a fitted kriging model. Rather than fitting the model from scratch with the updated observations added, the results of the fit as stored in object are used to achieve some savings.

### Usage

```

## S4 method for signature 'NoiseKM'
update(
  object,
  newX,
  newy,
  newnoise.var,
  newX.alreadyExist = FALSE,
  cov.reestim = TRUE,
  trend.reestim = cov.reestim,
  nugget.reestim = FALSE,
  kmcontrol = NULL,
  newF = NULL,
  ...
)

```

### Arguments

object            A NoiseKM object.

<code>newX</code>	A numeric matrix containing the new design points. It must have <code>object@X</code> columns in correspondence with those of the design matrix used to fit the model which is stored as <code>object@X</code> .
<code>newy</code>	A numeric vector of new response values, in correspondence with the rows of <code>newX</code> .
<code>newnoise.var</code>	Variance of an additional noise on the new response.
<code>newX.alreadyExist</code>	Logical. If TRUE, <code>newX</code> can contain some input points that are already in <code>object@X</code> .
<code>cov.reestim</code>	Logical. If TRUE, the vector <code>theta</code> of correlation ranges will be re-estimated using the new observations as well as the observations already used when fitting <code>object</code> . Only TRUE can be used for now.
<code>trend.reestim</code>	Logical. If TRUE the vector <code>beta</code> of trend coefficients will be re-estimated using all the observations. Only TRUE can be used for now.
<code>nugget.reestim</code>	Logical. If TRUE the nugget effect will be re-estimated using all the observations. Only FALSE can be used for now.
<code>kmcontrol</code>	A list of options to tune the fit. Not available yet.
<code>newF</code>	New trend matrix. XXXY?
<code>...</code>	Ignored.

### Details

Without a dedicated update method for the class "NoiseKM", this would have been inherited from the class "km". The dedicated method is expected to run faster. A comparison can be made by coercing a NoiseKM object to a km object with `as.km` before calling `update`.

### Value

The updated NoiseKM object.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

update,NuggetKM-method

*Update a NuggetKM Object with New Points*

---

## Description

The update method is used when new observations are added to a fitted kriging model. Rather than fitting the model from scratch with the updated observations added, the results of the fit as stored in object are used to achieve some savings.

## Usage

```

## S4 method for signature 'NuggetKM'
update(
  object,
  newX,
  newy,
  newX.alreadyExist = FALSE,
  cov.reestim = TRUE,
  trend.reestim = cov.reestim,
  nugget.reestim = FALSE,
  newnoise.var = NULL,
  kmcontrol = NULL,
  newF = NULL,
  ...
)

```

## Arguments

object            A NuggetKM object.

newX	A numeric matrix containing the new design points. It must have object@columns in correspondence with those of the design matrix used to fit the model which is stored as object@X.
newy	A numeric vector of new response values, in correspondence with the rows of newX.
newX.alreadyExist	Logical. If TRUE, newX can contain some input points that are already in object@X.
cov.reestim	Logical. If TRUE, the vector theta of correlation ranges will be re-estimated using the new observations as well as the observations already used when fitting object. Only TRUE can be used for now.
trend.reestim	Logical. If TRUE the vector beta of trend coefficients will be re-estimated using all the observations. Only TRUE can be used for now.
nugget.reestim	Logical. If TRUE the nugget effect will be re-estimated using all the observations. Only FALSE can be used for now.
newnoise.var	Optional variance of an additional noise on the new response.
kmcontrol	A list of options to tune the fit. Not available yet.
newF	New trend matrix. XXXY?
...	Ignored.

### Details

Without a dedicated update method for the class "NuggetKM", this would have been inherited from the class "km". The dedicated method is expected to run faster. A comparison can be made by coercing a NuggetKM object to a km object with [as.km](#) before calling update.

### Value

The updated NuggetKM object.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### See Also

[as.km](#) to coerce a NuggetKM object to the class "km".

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(5))
y <- f(X) + 0.01*rnorm(nrow(X))
points(X, y, col = "blue")
KMobj <- NuggetKM(design = X, response = y, covtype = "gauss")
x <- seq(from = 0, to = 1, length.out = 101)
```

```

---

update.Kriging	<i>Update a Kriging model object with new points</i>
----------------	--

---

## Description

Update a Kriging model object with new points

## Usage

```

## S3 method for class 'Kriging'
update(object, y_u, X_u, refit = TRUE, ...)

```

## Arguments

object	S3 Kriging object.
y_u	Numeric vector of new responses (output).
X_u	Numeric matrix of new input points.
refit	Logical. If TRUE the model is refitted (default is FALSE).
...	Ignored.

## Value

No return value. Kriging object argument is modified.

## Caution

The method *does not return the updated object*, but instead changes the content of object. This behaviour is quite unusual in R and differs from the behaviour of the methods `update.km` in **DiceKriging** and `update,KM-method`.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)
points(X, y, col = "blue")

k <- Kriging(y, X, "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
p <- predict(k, x)
lines(x, p$mean, col = "blue")
polygon(c(x, rev(x)), c(p$mean - 2 * p$stdev, rev(p$mean + 2 * p$stdev)),
  border = NA, col = rgb(0, 0, 1, 0.2))

X_u <- as.matrix(runif(3))
y_u <- f(X_u)
points(X_u, y_u, col = "red")

## change the content of the object 'k'
update(k, y_u, X_u)

## include design points to see interpolation
x <- sort(c(X, X_u, seq(from = 0, to = 1, length.out = 101)))
p2 <- predict(k, x)
lines(x, p2$mean, col = "red")
polygon(c(x, rev(x)), c(p2$mean - 2 * p2$stdev, rev(p2$mean + 2 * p2$stdev)),
  border = NA, col = rgb(1, 0, 0, 0.2))
```

---

update.NoiseKriging    *Update a NoiseKriging model object with new points*

---

**Description**

Update a NoiseKriging model object with new points

**Usage**

```
## S3 method for class 'NoiseKriging'
update(object, y_u, noise_u, X_u, refit = TRUE, ...)
```

**Arguments**

object	S3 NoiseKriging object.
y_u	Numeric vector of new responses (output).
noise_u	Numeric vector of new noise variances (output).
X_u	Numeric matrix of new input points.
refit	Logical. If TRUE the model is refitted (default is FALSE).
...	Ignored.

**Value**

No return value. NoiseKriging object argument is modified.

**Caution**

The method *does not return the updated object*, but instead changes the content of object. This behaviour is quite unusual in R and differs from the behaviour of the methods `update.km` in **DiceKriging** and `update,KM-method`.

**Author(s)**

Yann Richet <yann.richet@irsu.fr>

```

---

update_simulate	<i>Update simulation of model on data.</i>
-----------------	--

---

## Description

Update previous simulate of a model given in object.

## Usage

```
update_simulate(object, ...)
```

## Arguments

object	An object representing a fitted model.
...	Further arguments of function

## Value

Updated simulation of model output.

---

```
update_simulate.Kriging
```

*Update previous simulation of a Kriging model object.*

---

### Description

This method draws paths of the stochastic process conditional on the values at the input points used in the fit, plus the new input points and their values given as argument (known as 'update' points).

### Usage

```
## S3 method for class 'Kriging'
update_simulate(object, y_u, X_u, ...)
```

### Arguments

object	S3 Kriging object.
y_u	Numeric vector of new responses (output).
X_u	Numeric matrix of new input points.
...	Ignored.

### Value

a matrix with `nrow(x)` rows and `nsim` columns containing the simulated paths at the input points given in `x`.

### Author(s)

Yann Richet <yann.richet@irsn.fr>

### Examples

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X)
points(X, y, col = "blue")

k <- Kriging(y, X, kernel = "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
s <- k$simulate(nsim = 3, x = x, will_update = TRUE)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")
```

```
X_u <- as.matrix(runif(3))
y_u <- f(X_u)
points(X_u, y_u, col = "red")

su <- k$update_simulate(y_u, X_u)

lines(x, su[ , 1], col = "blue", lty=2)
lines(x, su[ , 2], col = "blue", lty=2)
lines(x, su[ , 3], col = "blue", lty=2)
```

---

update\_simulate.NoiseKriging

*Update previous simulation of a NoiseKriging model object.*

---

### Description

This method draws paths of the stochastic process conditional on the values at the input points used in the fit, plus the new input points and their values given as argument (known as 'update' points).

### Usage

```
## S3 method for class 'NoiseKriging'
update_simulate(object, y_u, noise_u, X_u, ...)
```

### Arguments

object	S3 NoiseKriging object.
y_u	Numeric vector of new responses (output).
noise_u	Numeric vector of new noise variances (output).
X_u	Numeric matrix of new input points.
...	Ignored.

### Value

a matrix with  $nrow(x)$  rows and  $nsim$  columns containing the simulated paths at the input points given in  $x$ .

### Author(s)

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + X/10 * rnorm(nrow(X))
points(X, y, col = "blue")

k <- NoiseKriging(y, (X/10)^2, X, "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
s <- k$simulate(nsim = 3, x = x, will_update = TRUE)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")

X_u <- as.matrix(runif(3))
y_u <- f(X_u) + 0.1 * rnorm(nrow(X_u))
points(X_u, y_u, col = "red")

su <- k$update_simulate(y_u, rep(0.1^2,3), X_u)

lines(x, su[, 1], col = "blue", lty=2)
lines(x, su[, 2], col = "blue", lty=2)
lines(x, su[, 3], col = "blue", lty=2)
```

---

```
update_simulate.NuggetKriging
```

*Update previous simulation of a NuggetKriging model object.*

---

**Description**

This method draws paths of the stochastic process conditional on the values at the input points used in the fit, plus the new input points and their values given as argument (known as 'update' points).

**Usage**

```
## S3 method for class 'NuggetKriging'
update_simulate(object, y_u, X_u, ...)
```

**Arguments**

object	S3 NuggetKriging object.
y_u	Numeric vector of new responses (output).
X_u	Numeric matrix of new input points.
...	Ignored.

**Value**

a matrix with `nrow(x)` rows and `nsim` columns containing the simulated paths at the inputs points given in `x`.

**Author(s)**

Yann Richet <yann.richet@irsn.fr>

**Examples**

```
f <- function(x) 1 - 1 / 2 * (sin(12 * x) / (1 + x) + 2 * cos(7 * x) * x^5 + 0.7)
plot(f)
set.seed(123)
X <- as.matrix(runif(10))
y <- f(X) + 0.1 * rnorm(nrow(X))
points(X, y, col = "blue")

k <- NuggetKriging(y, X, "matern3_2")

x <- seq(from = 0, to = 1, length.out = 101)
s <- k$simulate(nsim = 3, x = x, will_update = TRUE)

lines(x, s[, 1], col = "blue")
lines(x, s[, 2], col = "blue")
lines(x, s[, 3], col = "blue")

X_u <- as.matrix(runif(3))
y_u <- f(X_u) + 0.1 * rnorm(nrow(X_u))
points(X_u, y_u, col = "red")

su <- k$update_simulate(y_u, X_u)

lines(x, su[, 1], col = "blue", lty=2)
lines(x, su[, 2], col = "blue", lty=2)
lines(x, su[, 3], col = "blue", lty=2)
```
